Team member: Mohamed Waseem M

Description above project:

This project helps manage who can see, edit, or control certain parts of a system. It makes user access faster, safer, and easier to handle for both users and administrators.

Ideation phase

Brainstorming & idea prioritization template.

(Phase-1)

Date	November 4		
Team ID	NM2025TMID06138		
Project name	Optimizing user group &role management with		
	access control and control flow		
Maximum marks	4 marks		

Title theme:

This title is about improving how users are organized, assigned roles, and given permissions in a system — so that security and efficiency are both strong.

- 1. User Group Management → Grouping users (e.g., Admins, Managers, Employees).
- Role Management → Assigning what each group can do (e.g., Admin can add users, Employee can view only).
- 3. Access Control → Setting clear permissions: who can access what (files, features, data).
- 4. Optimization → Making the whole process faster, simpler, and more secure reducing errors, duplication, and unauthorized access.

Golden rules for great ideas:

Rule:

What is mean for our service now project

Volume over value:

The system should be able to handle high user volume (many users and roles) while maintaining quick access control, permissions, and role assignments without slowing performance.

Example:

Automating role assignments for 10,000+ users instead of manually approving a few users at a time.

Definition:

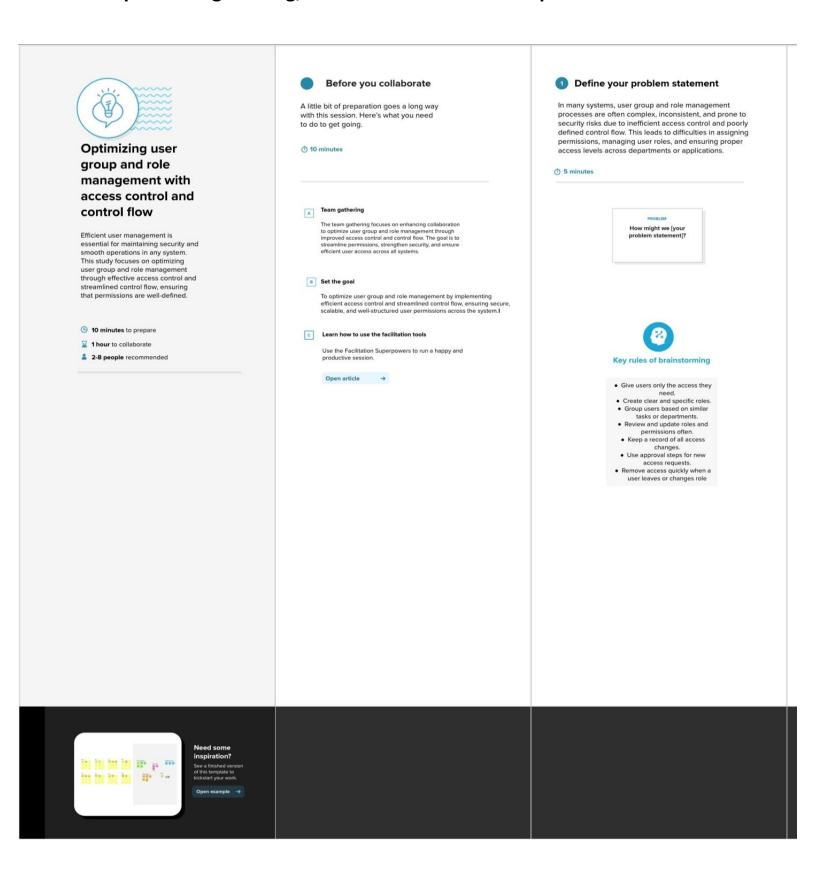

Focusing on managing a large number of users and groups efficiently rather than handling only high-value or limited users.

Using the idea template:

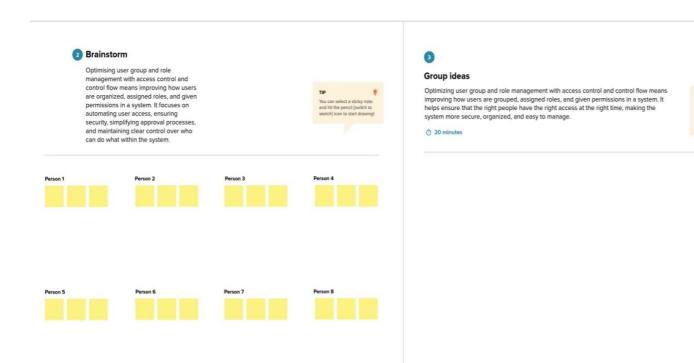

An Idea Template in ServiceNow is a structured format used to capture, organize, and evaluate new ideas or improvement suggestions within an organization. It serves as a standardized framework for users to submit ideas related to process enhancement, automation, innovation, or service improvement.

This template helps ensure that every idea is documented with key details—such as the problem statement, proposed solution, business impact, and effort required—making it easier for review teams to analyze, prioritize, and implement the most valuable ideas using the ServiceNow Idea Management module.

Step 1: team gathering, collaboration & select the problem statement.

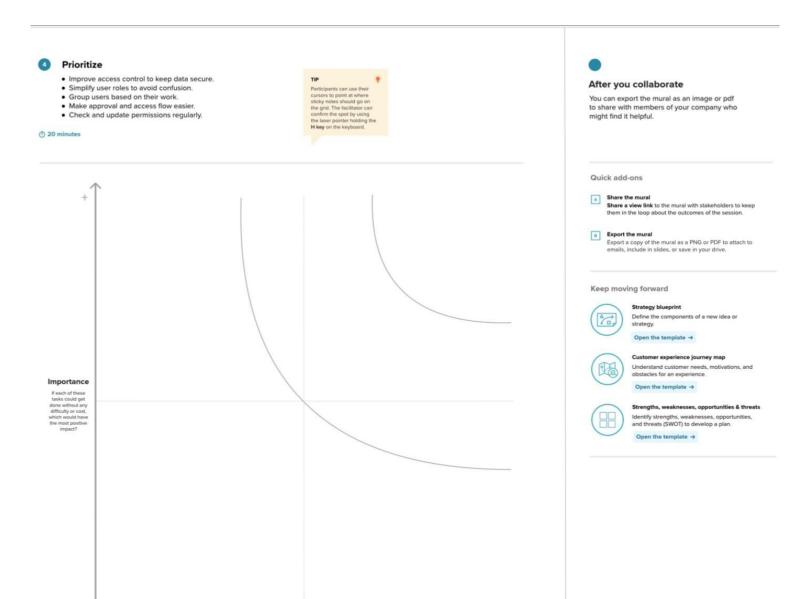

Step 2: group idea, brainstorming.

Step 3: prioritize

Feasibility

Define the problem statement

The service now problem statement:

In large organizations or digital systems, managing users, groups, and roles effectively is crucial for ensuring proper access control and data security. However, as the number of users and roles increases, maintaining accurate permissions, avoiding redundancy, and ensuring efficient workflows become challenging.

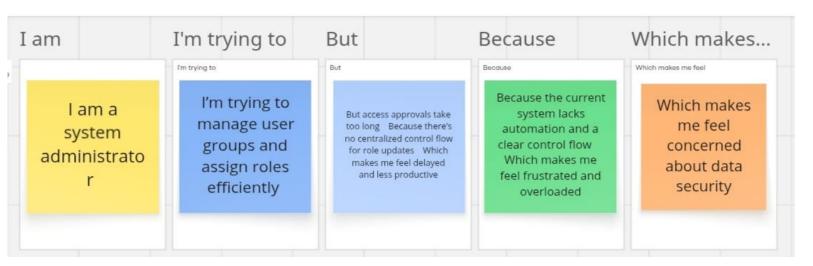

Goal	To design and implement an optimized system for managing user groups, roles, and access control that ensures security, efficiency, and streamlined workflows.
Key Objectives	Simplify user-role and group assignments. - Automate access control and approval workflows. - Eliminate redundant or overlapping roles. - Enhance system security and compliance. - Reduce manual administrative workload. >- Improve transparency and traceability of user permissions.
Scope of This project Purpose of this project	To centralize and simplify user and role management. control processes and approval workflows. consistent user permissions across the system. consistent user permissions across the system. and enhance system transparency. To design and implement an optimized system for managing user groups, roles, and access control that ensures security, efficiency, and streamlined workflows.
Expected Outcome	Improved operational efficiency. - Faster user onboarding/offboarding. - Better access accuracy and consistency. - Strengthened data protection and control. - Reduced risk of unauthorized access.

Customer problem statement template

Customers often face major challenges in managing multiple user groups and roles within their organization. As the number of users increases, manually assigning permissions and maintaining proper access control becomes complicated and time-consuming. This leads to frequent errors, unauthorized access, and delays in completing tasks. Employees often experience frustration when they cannot access the right resources at the right time, while administrators struggle to keep track of permissions and workflows. To solve this problem, customers need a centralized and automated system that optimizes user group and role management, ensures secure access control, and streamlines control flow. Such a solution would improve efficiency, reduce security risks, and help organizations maintain clear and consistent access policies across all departments.

l am	A system administrator	
I am trying to	I'm trying to manage user groups and assign roles efficiently	
But	But access approvals take too long Because there's no centralized control flow for role updates Which makes me feel delayed and less productive	
Because	Because the current system lacks automation and a clear control flow Which makes me feel frustrated and overloaded	
Which make me feel	Which makes me feel concerned about data security	

Example:

PS(problem statement)		I am trying to	But	Which makes me feel
PS-1 (Admin Interface)	A dedicated system administrattor	Manage employee roles and permissions	The interface is complex and time-consuming	I get frustrated a lot
PS-2 (Data Access)	A data scientist	I don't have access to certain data	There is no clear, secure access-control system	I feel 'tuck and unable to analyze tremds

Empathy map canva for Optimizing user group and role management with access control and control flow:

The users of this system mainly include system administrators, IT managers, application developers, and end users who access role-based platforms. They often express frustration about the difficulty of managing multiple users and roles manually, emphasizing the need for a simple dashboard to assign and track permissions. Many say that too many access requests slow down the workflow and that maintaining strong security is a constant challenge.

In their thoughts, users often feel that there must be a smarter and more automated way to handle access control. They worry that improper permission settings could lead to data breaches or compliance violations and believe that better visibility into who has access to what would improve both safety and efficiency.

From their peers and management, users frequently hear comments about failed audits, security risks, and how other organizations use centralized tools to manage roles more effectively.

Empathy Map

Optimizing user group and role management with access control
